

Bahama Shutter Installation Instructions

- 1- Install the top hinge to the wall, over the opening, using approved fasteners for the particular application - ,centered over the opening and level.
- 2- Attach the shutter panel - male hinge insert on the top portion of the panel inserted into the female opening in the bahama top hinge (mounted to wall).
- 3- Install the bahama arm at the top of the sliding arm into the bahama panel threaded insert located on the side of the panel with 1/4 x 20 phillip screw.
- 4- Install camel bracket into the wall approximately 1/4' away from the side of the bahama panel at a location to the customer's choosing. Typically, the camel bracket is installed even with the bottom of the panel or nearby. The higher up the camel bracket is installed, the farther out the panel will pitch. Please note that you should test to insure fit with the arm prior to installing the camel bracket.
- 5- Connect the lower section of the sliding arm into the camel bracket with the L-shaped pin.
- 6- Tighten adjustment screw on adjustment collar on the sliding arm to secure the proper angle of projection on the bahama shutter panel.

For installation on block or concrete, secure the top hinge with 1/4 x 1-3/4 tapcon at 12" o.c. 2 tapcons per camel bracket (4) will be required as well.
